IN REPLY REFER TO

ORNED-G

9 Jun 1981

Nashville, TN 37219

Honorable Lamar Alexander Governor of Tennessee

Dear Governor Alexander:

Furnished herewith is the Phase I Investigation Report on Jennings Creek Watershed Dam No. 16 near North Springs, Tennessee. The report was prepared under the authority and provisions of PL 92-367, the National Dam Inspection Act, dated 8 August 1972.

The report presents details of the field inspection, background information, technical analyses, findings, and recommendations for improving the condition of the dam.

Based upon the inspection and subsequent evaluation, Jennings Creek Watershed Dam No. 16 has insufficient storage and spillway capacity to pass the probable maximum flood and excessive growth of trees and brush on the embankment. Because of these deficiencies, this dam is classified as significantly deficient.

The recommendation concerning project modifications to allow safe passage of the design flood and others contained in this report should be undertaken in the near future.

Public release of the report and initiation of public statements fall within your prerogative. However, under provisions of the Freedom of Information Act, the Corps of Engineers is required to respond fully to inquiries on information contained in the report and to make it accessible for review on request.

Your assistance in keeping me informed of any further developments will be appreciated.

l Incl As stated LEE W. TUCKER

Ancerely,

Colonel, Corps of Engineers Commander

CF:

Mr. Robert A. Hunt, Director Division of Water Resources 4721 Trousdale Drive Nashville, TN 37220

#### PREFACE

This report is prepared under guidance contained in the Department of the Army, Office of the Chief of Engineers, Recommended Guidelines for Safety Inspection of Dams, for a Phase I investigation. The purpose of the Phase I investigation is to identify expeditiously those dams which may pose hazards to human life or property. The assessment of the general condition of the dam is based upon available data and visual inspections. Detailed investigation and analyses involving topographic mapping, subsurface investigations, testing, and detailed computational evaluations are beyond the scope of a Phase I investigation; however, the investigation is intended to identify any need for such studies.

In the review of this report, it should be realized that the reported condition of the dam is based on observations of field conditions at the time of inspection along with data available to the inspection team. Additional data or data furnished containing incorrect information could alter the findings of this report. In cases where the reservoir was lowered or drained prior to inspection, such action, while improving the stability and safety of the dam, removes the normal load on the structures and may obscure certain conditions which might be detectable if inspected under the normal operating environment of the structure.

The analyses and recommendations included in this report are related to the hazard classification of the structure at the time of the report. Changes in conditions downstream of the dam may change the hazard classification of the structure. A change in hazard classification may in turn change the design flood on which the hydraulic and hydrologic analyses are based and may have a significant impact on the assessment of the safety of the structure.

It is important to note that the condition of a dam depends on numerous and constantly changing internal and external conditions and is evolutionary in nature. It would be incorrect to assume that the present conditions of the dam will continue to represent the condition of the dam at some point in the future. Only through continued care and inspections can there be any chance that unsafe conditions will be detected.

Jennings Creek Dam No. 16

Macon County

April 2, 1981

## PHASE I INSPECTION REPORT NATIONAL DAM SAFETY PROGRAM TENNESSEE

Name of Dam Jennings Creek Watershed Dam No. 16
County Macon
Stream Trib. Jennings Creek at Donoho Hollow
Date of Inspection January 8, 1981

#### **ABSTRACT**

The dam is a linear earthen structure 325 feet long and 47.1 feet high with a crest width of 13 feet. The upstream and downstream slopes are 2.4H:1V and 2.7H:1V respectively. It is in the intermediate size and high hazard potential classifications. The lake area is 7 acres at normal pool, increasing to 23 acres at the top of the dam. The service spillway is a 2' x 6' (inside diameter) concrete riser with a 15" steel cylinder concrete pipe. The drawdown consists of a 16" diameter formed opening feeding into the riser controlled by a 24" slide headgate. The emergency spillway is an open channel excavated in rock at the right side of the embankment. It has a base width of 25 feet and is trapezoidal in shape.

The dam is well grassed and free of undesirable vegetation. Its slopes are uniform and well defined and exhibit no signs of structural instability. Some minor erosion exists on the downstream slope in two areas where construction equipment and 4-wheel drive vehicles have destroyed the grass cover. No cracks, signs of seepage, sliding, or differential settlement were observed on the dam or in the area immediately downstream.

The dam is given a safety classification of "significantly deficient" because of its spillway limitations.

It is recommended that a qualified engineer be engaged to develop project modifications that will allow the dam to pass the PMF, and that the owner perform various maintenance operations.

#### PHASE I INSPECTION REPORT NATIONAL DAM SAFETY PROGRAM JENNINGS CREEK WATERSHED DAM NO. 16 MACON COUNTY, TENNESSEE

#### SECTION 1 - GENERAL

- Authority The Phase I inspection of this dam was conducted under the authority of the Tennessee Code Annotated, Section 70-2501 to 70-2530, "The Safe Dams Act of 1973", in cooperation with the U. S. Army Corps of Engineers under the authority of Public Law 92-367, "The National Dam Inspection Act".
- Purpose and Scope The purpose of a Phase I investigation is to develop an engineering assessment of the general condition of a dam with respect to safety and stability. This is accomplished by conducting a visual inspection; reviewing any available design and construction data; and performing appropriate hydraulic, hydrologic, and other analyses. A comprehensive description of the Phase I investigation program is given in Recommended Guidelines for Safety Inspection of Dams, by the Department of the Army, Chief of Engineers, Washington, D. C. 20314.
- Past Inspections The dam is inspected at least annually by the SCS to provide maintenance recommendations for the Watershed District Board.
- Details of Inspection The Phase I visual inspection of Jennings Creek Watershed Dam No. 16 was conducted under partly cloudy skies with a temperature of 25-30° F. The lake was frozen over and 1" of melting snow was on the ground. The inspection was not significantly hindered by the snow, however, because the direct exposure of the embankment to the sunlight kept it clearer than the adjacent ground.
- 1.5 <u>Inspection Team Members</u> Field inspection was performed by the following State personnel:

Edmond O'Neill Robert Ramsey William Culbert, Jr.

The team was accompanied by Al Dunn (Corps of Engineers) and Perry Fuqua (SCS).

#### SECTION 2 - PROJECT DESCRIPTION

- 2.1 Location Jennings Creek Watershed Dam No. 16 is located in Macon County, Tennessee, approximately 800 feet north of State Highway 56 and 400 feet west of the Macon-Jackson County line. The dam is on the Donoho Hollow tributary of Jennings Creek. It is shown on the U. S. Geological Survey 7.5 minute Willette Quadrangle map at latitude 36028'll" N and longitude 85049'l5" W. Location maps are provided in Appendix B of this report.
- History of Project The dam was completed in 1960 under the authority of the watershed protection and flood prevention act (Public Law 566). It is one of a series of dams sponsored by the Jennings Creek Watershed District, the Jackson County Soil Conservation District, the Macon County Soil Conservation District, and the Clay County Soil Conservation District, with design assistance from the Soil Conservation Service. The owner of the project is Glenn Donoho. Construction was by Farrar of McMinnville.
- 2.3 Size and Hazard Classification The dam is in the intermediate size classification, with a measured height of 47.1 feet. Reservoir storage is calculated as 41 acre-feet at normal pool and 400 acrefeet at maximum pool (top of dam). The dam is classified as high hazard because of the presence of a house several hundred feet downstream of the dam (see photo no. 5).
- 2.4 Description of Dam and Appurtenances
- 2.4.1 Embankment The embankment is an earthfill structure presumably constructed using residual clay derived from the in-situ weathering of the underlying bedrock.

The dam is 47.1 feet high and 325 feet long with a crest width of 13 feet. The crest varies in elevation from 726.1 feet to 727.6 feet. The downstream and exposed upstream slopes of the dam are 2.7H:1V and 2.4H:1V respectively. Below the 10 foot wave berm at normal pool, the upstream slope is 2.6H:1V.

The dam is underlain by Mississippian Age and Ordovician formations of high chert limestone. The bedding planes are mostly horizontal with appreciable cavernous solution zones.

- 2.4.2 Service Spillway The principal spillway maintains normal pool at elevation 701.0. It consists of a 2' x 6' (inside diameter) reinforced concrete riser 20' tall feeding a 15" steel cylinder concrete pressure pipe 261 feet long (see photo nos. 7 and 8).
- Emergency Spillway The emergency spillway is an open channel excavated in rock, right of the embankment. Its cross-section is trapezoidal with left and right side slopes of 2.5H:lV and 2.2H:lV respectively and a base width of 25 feet. About 4.7 feet above the effective spillway crest elevation of 718.5, the right side slope changes to approximately vertical and extends upward 16 feet, well above the dam. The approach and exit channels are sloped at 5% and 2% respectively (see photo nos. 9 and 10).
- 2.4.4 Drawdown Facilities The drawdown facilities consist of a 16" diameter inlet (invert elevation 683.0) controlled by a 24" sliding headgate. The gate is manually operated from the top of the riser (see photo no. 7).
- 2.5 Downstream Channel The downstream channel lies on a 1.5% slope. It has a V-shaped cross-section with a top width of approximately 20 feet and a depth of 4 feet. Seven hundred feet downstream of the embankment the channel passed under a highway bridge. In this area, it widens and deepens as it extends out of the hollow and into the bottomland (see photo no. 5).
- Reservoir and Drainage Area At normal pool elevation 701.0, the reservoir has a calculated storage capacity of 41 acre-feet with a surface area of 7 acres. At the top of the dam the reservoir volume is approximately 400 acre-feet with a pool surface area of 23 acres. The drainage area for the lake is 736 acres (1.150 mi<sup>2</sup>). The average ground slope is 30%. About 2900 feet upstream of the dam, the

drainage area divides into two sub-basins. The watercourse of the northernmost branch is a few hundred feet longer than the other.

Major soil types in the area include Bodine, Mountview, Delrose, Dickson, and Mimosa. The basin is predominantly wooded.

#### SECTION 3 - FINDINGS

#### 3.1 Visual Inspection

- 3.1.1 Embankment The dam is well grassed and free of deleterious vegetation except for a few copse along the downstream toe and scattered other locations. The crest and side slopes are uniform and well defined, exhibiting no signs of instability. No cracks, indications of seepage, sliding, or differential settlement were observed on the dam or in the area immediately downstream. Erosion from surface runoff is insignificant (See photo no. 6).
- 3.1.2 Service Spillway The riser appears to be in excellent condition with no noteworthy cracking or weathering. The drawdown gate and operating mechanism have been recently installed and appear to be operable (see photo no. 7). The spillway culvert is presumably in good condition also as evidenced by the appearance of the outfall (see photo no. 8).
- 3.1.3 Emergency Spillway The emergency spillway is relatively uniform over its entire length with no major obstructions. No significant erosion was observed (see photo nos. 9, 10, and 11).
- 3.1.4 Downstream Channel The channel is covered with perennial growth and seedlings. It is reasonably well defined and uniform for a natural channel and shows signs of only minor erosion.
- 3.1.5 Reservoir and Drainage Area The lake floor is clear of trees and debris, and sediment is minimal because the drainage area is predominantly wooded. The reservoir was emptied in the summer of 1980 to allow installation of a 24" sliding headgate over the drawdown inlet. The valve was closed sometime after a field visit on November 5, 1980. At the time of the inspection, the water level had come within 2 feet of reaching normal pool elevation.

Review of Data - Information available for review includes the SCS as-built drawings and the Water-shed Work Plan prepared by Jennings Creek Watershed District, the SCS, and Soil Conservation Districts of Jackson, Clay, and Macon Counties.

The bedrock within the Jennings Creek Watershed consists of formations of Ordovician and Mississippian Age. The rock strata has nearly horizontal bedding. The composition of the rock ranges from thin to massive bedded limestone, cherty limestone, shaly limestone, and shale. There are extensive outcrops of bedrock on the steeper slopes with intermittent areas of shallow residual soil overburden. The presence of cherty limestone formations had led to high chert content in the colluvial and alluvial soils and in many of the residual soils. Many solution zones are present in the limestone bedrock. These are in the form of caverns, solution planes, and small sink holes.

A cutoff trench was excavated into bedrock (approximate elevation 675) along the dam centerline. The "as built" drawings indicate that the channel was excavated at 1:1 side slopes to a 20 foot base.

- 3.3 Static and Seismic Stability The actual margin of safety for static stability cannot be determined because the engineering data required for an analytical stability analysis are not available. However, an assessment of the embankment stability based on visual evidence and engineering judgment would indicate a stable structure due to moderate embankment slopes and the lack of leaks or seepage. The project is located in Seismic Zone l and, according to OCE guidelines, should not be expected to be threatened by seismic effects provided static conditions are satisfied.
- Hydraulic and Hydrologic Analyses According to OCE guidelines, the design flood for an intermediate size dam in a high hazard area is the probable maximum flood (PMF). Hydraulic analysis indicates that outflow resulting from the PMF (AMC II) will overtop the dam by a maximum depth of 3.0 feet for a duration of 2.3 hours. Additional

analysis indicates that outflow from the \$PMF will overtop the dam by a maximum of 0.6 feet for 30 minutes.

#### 3.5 Conclusions and Recommendations

3.5.1 Conclusions - On the basis of visual evidence and engineering judgment, the dam is considered to be structurally stable. The embankment slopes are moderate and are considered adequate. No seepage problem appears to exist. The dam has the appearance that it is well constructed.

Hydraulic analysis indicates that the spillway will not pass the PMF as required by OCE guidelines for dams of intermediate size and high hazard potential.

The project is situated in Seismic Zone 1, indicating that risk of damage from seismic activity is minor.

The dam is considered to have a condition classification of "significantly deficient" solely because the spillway will not pass the specified design flood.

#### 3.5.2 Recommendations

- a) All woody vegetation should be removed from the embankment.
- b) Engage the services of a qualified engineer to develop project modifications to allow safe passage of the PMF.
- c) An emergency action plan should be developed, including a warning system to alert downstream residents, in the event a serious condition develops with the project.

#### SECTION 4 REVIEW BOARD FINDINGS

The Interagency Review Board for the National Program of Inspection of Non-Federal Dams met in Nashville on 10 April 1981 to examine the technical data contained in the Phase I investigation report for Jennings Creek Watershed Dam No. 16. The Review Board considered the information and recommended that (1) the ownership of the dam be clarified and the owner be made aware of his responsibilities in relation to the operation and maintenance of the structure, (2) an emergency action plan be developed, including a warning system to alert downstream resi- ; dents in the event that a serious condition develops with the project, and (3) the condition classification should be changed from "unsafe-nonemergency" to "significantly deficient." They agreed with other report conclusions and recommendations. the letter report presented by the Review Board is included in Appendix G.

APPENDIX A
DATA SUMMARY

### APPENDIX A DATA SUMMARY

- A.1 Dam
- A.1.1 Type The dam is a linear earthen structure with an open channel emergency spillway excavated in rock at the right abutment. The principal spillway is reinforced concrete with a steel cylinder concrete pressure pipe culvert.
- A.1.? Dimensions and Elevations Elevations are expressed in feet above mean sea level and are referenced to the invert of the principal spillway outlet, elevation 679.0, as given on the SCS design drawings.
  - a. Crest length 325'
  - b. Crest width 13'
  - c. Height 47.1
  - d. Crest elevation 726.1
  - e. Emergency spillway crest elevation 718.5
  - f. Principal spillway crest elevation 701.0
     (normal pool)
  - g. Embankment slope, upstream 2.4H:1V
  - h. Embankment slope, downstream 2.7H:1V
  - i. Size classification Intermediate
- A.1.3 Embankment Zoning None
- A.1.4 Cut-off and Grout Curtains A cut-off trench was excavated along the dam centerline to bedrock, approximate elevation 675. It was cut at I:1 side slopes to a 20' base. A rock toe was also designed to intercept seepage. It is excavated to bedrock and extends as high as normal pool elevation along the abutment tie-ins.

Grouting was minimal. Approximately a dozen holes were grouted, most near the right side of the dam along the centerline and perpendicular to this line approximately 50' right of the left abutment.

#### A.1.5 Instrumentation - None

A.1.6 Operation and Maintenance - Section 70-1801 through 70-1849 of the Tennessee Code Annotated (Watershed District Act of 1955) provides for the establishment of the Watershed Districts and the Watershed District Boards. Easement rights for the construction of the Jennings Creek Dams were obtained by the Board from the local property owners. The extent of ownership retained by the individuals is being negotiated, with the stipulation (Section 70-1847) that the Board has full operation and maintenance authority.

In the case of Jennings Creek, the entire Board has been liquidated through death or retirement. A written petition signed by 5% of the land owners in the watershed is required for it to be reestablished (by TCA Section 70-1822). A petition has been drafted and signed and is awaiting action from the court.

According to Perry Fuqua, SCS District Conservationist, Jackson County, the Watershed District is to make periodic inspections of the dams as needed and at least annually to determine any remedial measures needed.

A record of the inspections and maintenance operations is to be kept on file and will be available for use by representatives of the SCS. Specific maintenance agreements are to be executed prior to the construction of structural works of improvements.

#### A.2 Reservoir and Drainage Area

#### A.2.1 Reservoir

- a. Normal Pool
  - 1. Elevation 701.0
  - 2. Surface area 7 acres
  - 3. Storage 41 acre-feet
  - 4. Length of reservoir 1300'

- b. At Emergency Spillway Crest
  - 1. Elevation 718.5
  - 2. Surface area 16 acres
  - 3. Storage 244 acre-feet
- c. At Maximum Pool
  - 1. Elevation 726.1
  - 2. Surface area 23 acres
  - 3. Storage 400 acre-feet

#### A.2.2 Drainage Area

- a. Size 736 acres  $(1.150 \text{ mi}^2)$
- b. Soils Bodine, Mountview, Delrose, Mimosa
- c. Average slope 30%
- d. Land use Predominantly wooded, some pasture and roads.
- e. Runoff from PMP (28.5" in 6 hours)
  - 1. AMC II 24.5"
  - 2. AMC III 26.8"
- f. Runoff from 100 year storm (4.8" in 6 hours)
  - 1. AMC II 2.2"
  - 2. AMC III 3.4"

#### A.3 Outlet Structures

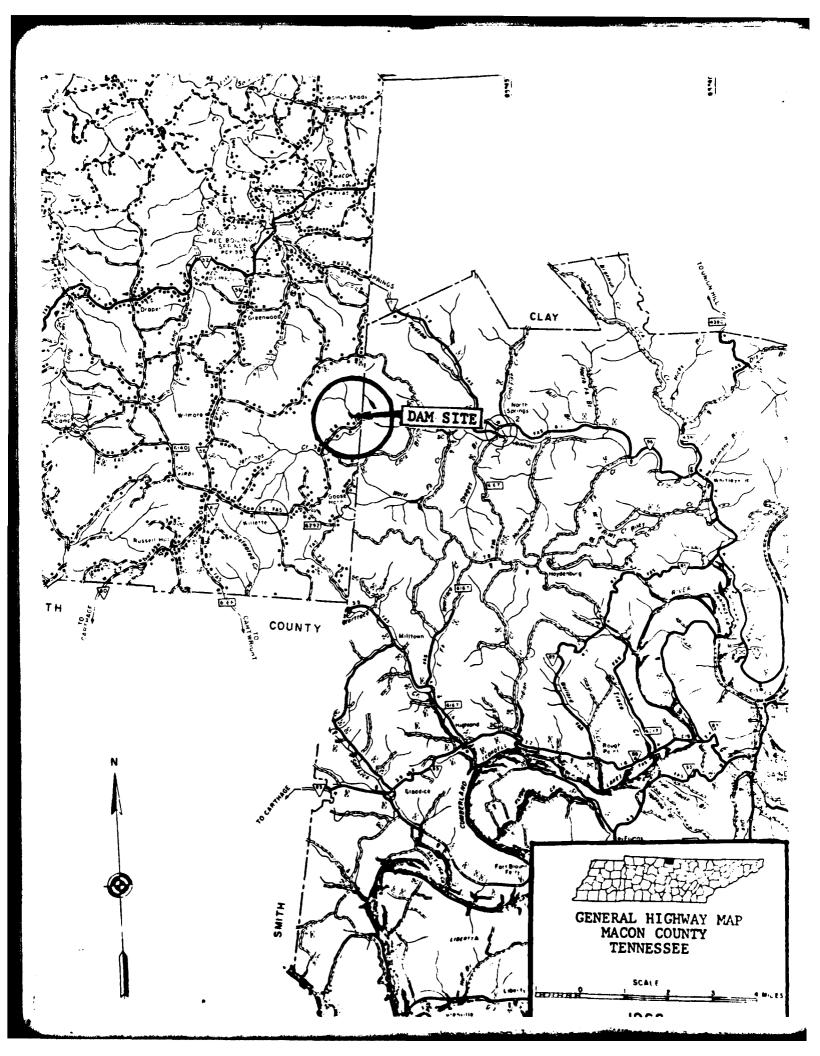

#### A.3.1 Service Spillway and Drawdown

- a. Type Single stage concrete riser and steel cylinder concrete pressure pipe.
- b. Size Riser 2' x 6' (inside diameter)
- c. Pipe gradient 1.5%
- d. Drawdown 16" diameter formed concrete opening covered by 24" slide headgate.

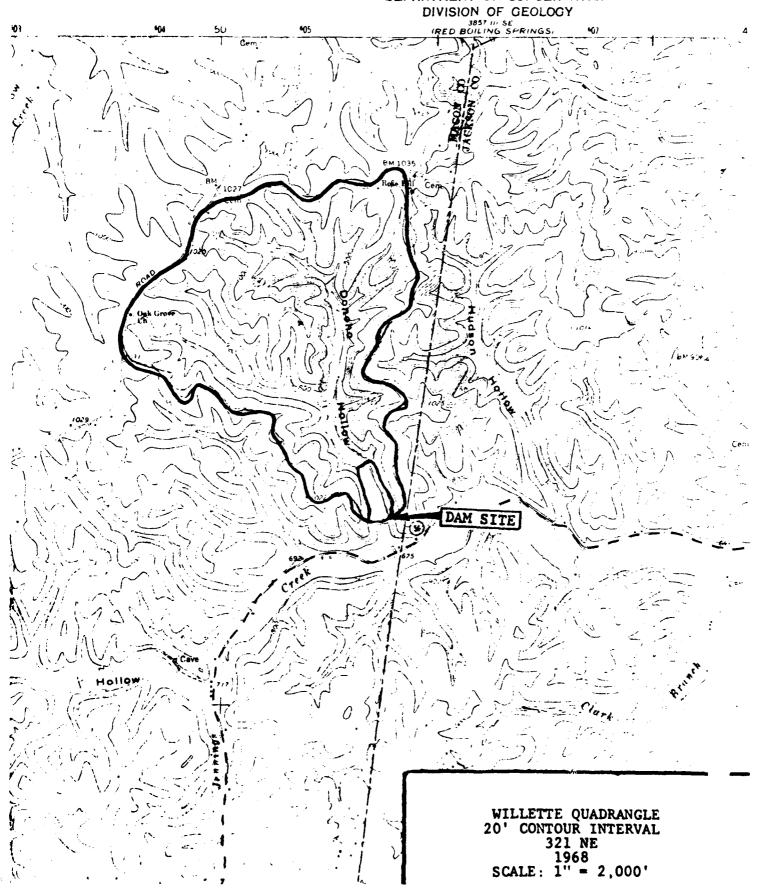

#### A.3.2 Emergency Spillway

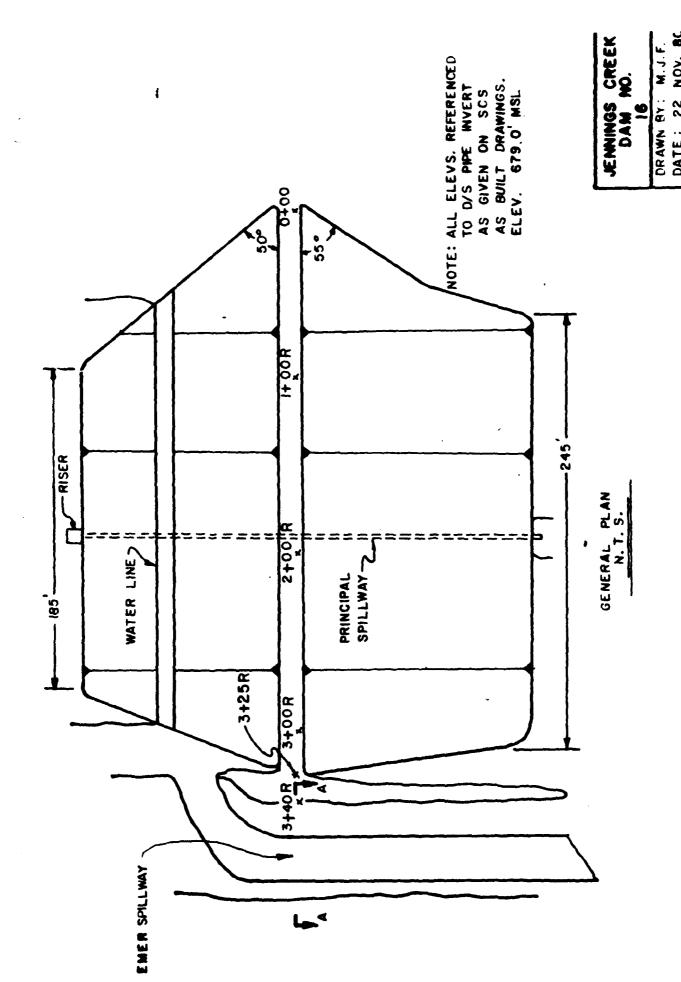

- a. Type Excavated in rock, left wall is fill material, right wall is natural bedrock.
- b. Size 25' bottom width, 7.6' available head, 2.5H:1V and 2.2H:1V side slopes, 4.7' above the spillway crest the steeper slope becomes vertical and extends 16' upward.
- c. Capacity 2508 cfs at top of dam.
- A.4 Historical Data
- A.4.1 Construction Date 1960
- A.4.2 Designer Soil Conservation Service
- A.4.3 Builder Farrar Construction Company, McMinnville
- A.4.4 Owner Glenn Donoho
- A.4.5 Previous Inspections by SCS
- A.4.6 Seismic Zone 1
- A.5 Downstream Hazard Data
- A.5.1 Downstream Hazard Potential Classification High
- A.5.2 Persons in Likely Flood Path Approximately 8
- A.5.3 Downstream Property 1 house several hundred feet downstream near channel elevation; State Route 56 crosses the channel approximately 800' downstream of the dam.
- A.5.4 Warning Systems None

APPENDIX F
HYDRAULIC AND HYDROLOGIC DATA

#### HYDROLOGIC AND HYDRAULIC ANALYSIS

According to OCE guidelines, Jennings Creek Watershed Dam No. 16 must be able to safely pass the Probable Maximum Flood (PMF) of 28.5" of rain falling in 6 hours. Six hour rainfall depths for the Probable Maximum Precipitation (PMP) and the 100-year rainfall were obtained from the U. S. Weather Service's Technical Paper 40. Flood routings were performed using the HEC-1-DB program. The program used the dimensionless hydrograph technique described in Section 4 of the Soil Conservation Service National Engineering Handbook and the Modified Puls method of reservoir routing.

With the existing spillway and assuming a level dam crest, the dam overtops for 2.3 hours with a maximum outflow of 9894 cfs. With a spillway cleared of rock debris and an uneven dam crest, the dam overtops for 2.0 hours with a maximum outflow of 9643 cfs.

# Data Sheet Jennings Creek Watershed Dam No. 16

#### Basin Characteristics:

A.	Watershed Si	ize	736 acres	s (1.150 m	i <sup>2</sup> )
л.	Mareralled Di	126	/30 acres	) (T.TOU III	_

B. Average Channel Slope 1.5%

C. Average Land Slope 30%

D. Hydrologic Soil Group Bodine, Mountview, Delrose,

Dickson, Mimosa

E. Time of Concentration 0.6 hours

F. SCS Curve Number 73 (AMC II) 87 (AMC III)

Reservoir Characteristics:

A. Normal Pool Elevation 701.0' msl

B. Dam Crest Elevation 726.1' msl

C. Normal Pool Area 6.9 acres

D. Normal Pool Length 1600'

E. Normal Pool Storage 41 acre-feet

F. Surcharge Storage Volume 359 acre-feet (Normal Pool to Dam Crest)

G. Surface Area at Dam Crest 23.4 acres

Emergency Spillway:

A. Type Saddle, trapezoidal,

earth, rock

B. Crest Elevation 718.5 (effective)

C. Maximum Discharge at Dam Crest 2970 cfs (modified spillway

and uneven crest)

Jennings Creek Watershed District Soil Conservation Service Gainesboro, TN 38562

Dear Dam Owner:

Tentative plans are to schedule a safety inspection of your dam within the next few months. A staff engineer will very shortly be in further communication with you to discuss the pending inspection and your responsibilities under the Safe Dams Act. Your immediate attention, however, is called to the matter of maintaining the earthen dam with a good grass cover and clear of all brush, undergrowth and tree growth. If these conditions do not presently exist, please make plans to remove the brush, undergrowth and all trees less than two inches in diameter as soon as possible. Larger trees may have to be removed at a later date but must be done so under the direction of an experienced engineer.

Flease let me, or our Chief Engineer, Mr. Ed O'Neill, know of any assistance we might be.

Very truly yours.

hobert A. Hunt, F.E.

Director, Division of Water Resources

NON-FEDERAL DAM INSPECTION REVIEW BOARD PO BOX 1070 NASHVILLE, TENNESSEE 37202

District Engineer, Nashville District US Army, Corps of Engineers PO Box 1070 Nashville, TN 37202

- 1. The Interagency Review Board, appointed by the District Engineer on 8 October 1980, presents the following recommendations after meeting on 10 April 1981 to consider the Phase I investigation report on Jennings Creek Watershed Dam No. 16 inspected by the Tennessee Department of Conservation.
- It is unclear as to the ownership of the dam and who is responsible for the operation and maintenance of the structure. This should be clarified and the owner be made aware of his responsibilities.
- 3. An emergency action plan should be developed, including a warning system to alert downstream residents, in the event a serious condition develops with the project.
- 4. The condition classification should be changed from "unsafe-nonemergency" to "significantly deficient."

The board is in agreement with report conclusions and recommendations following minor revisions.)
